

Smart Search and View Options (1)

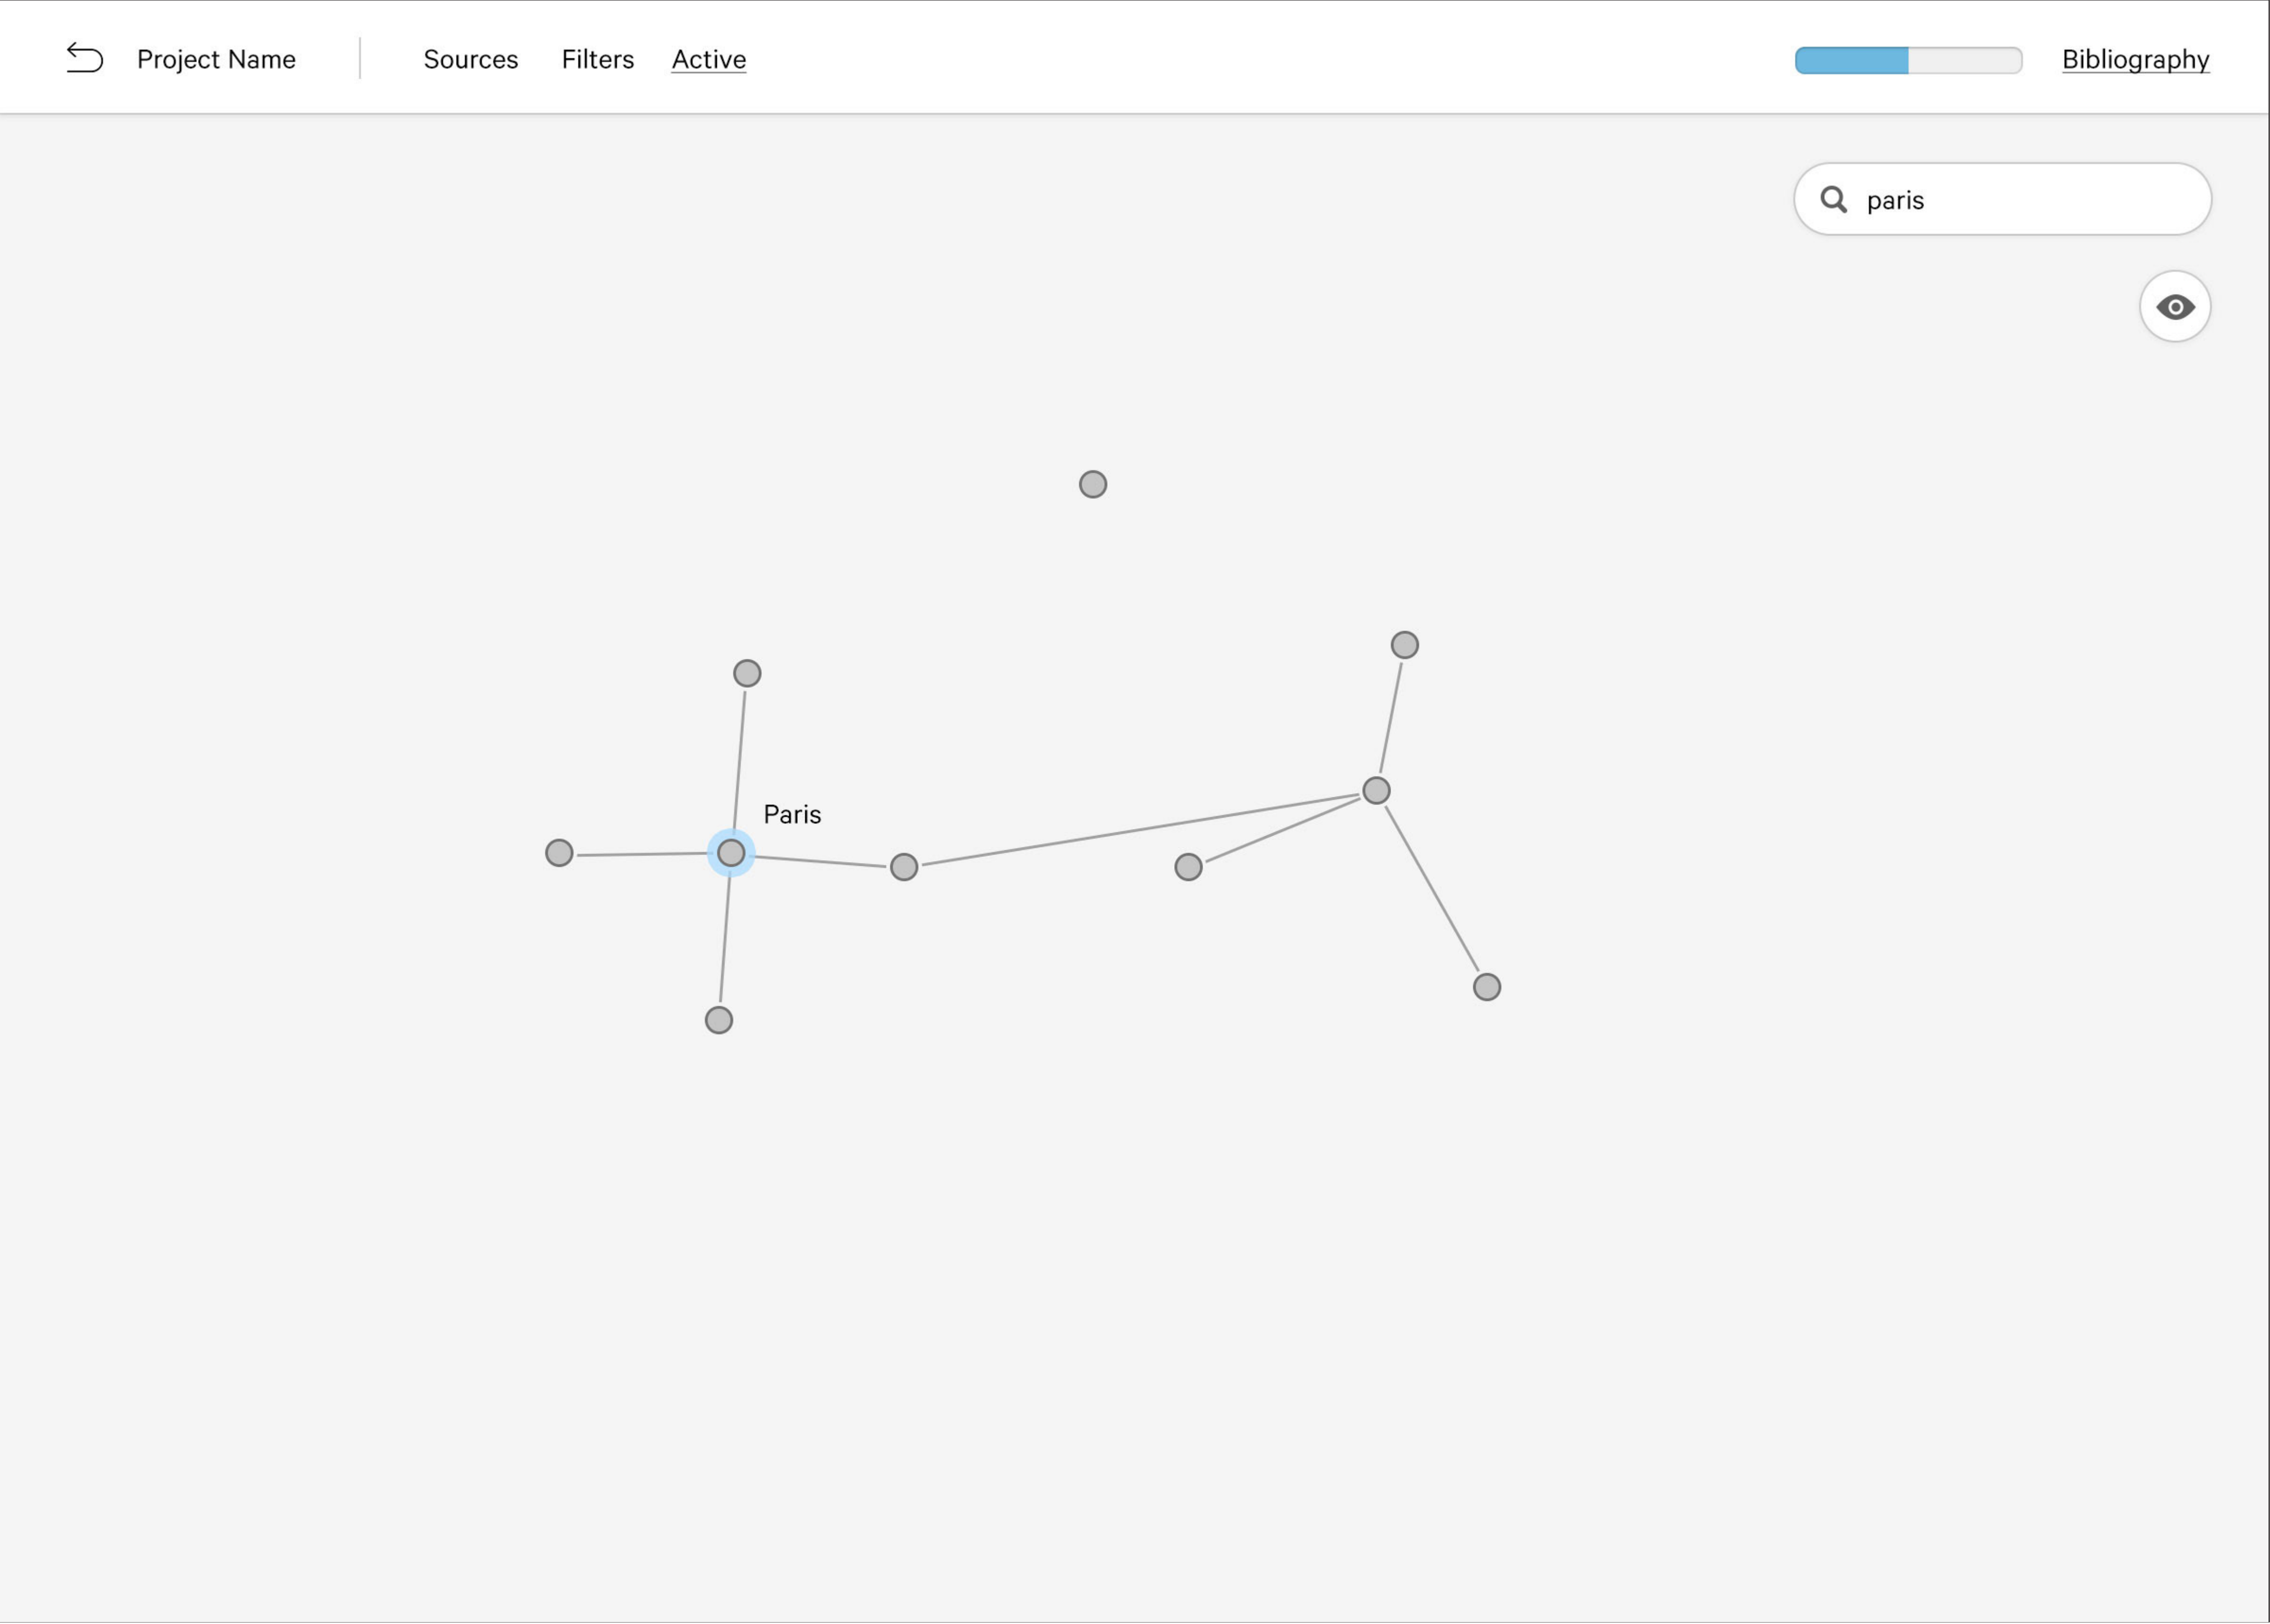

Here we have the active canvas, with some Person and Place nodes on it. We're going to use the smart search bar and view options to figure out what we're looking at.

Smart Search and View Options (2)

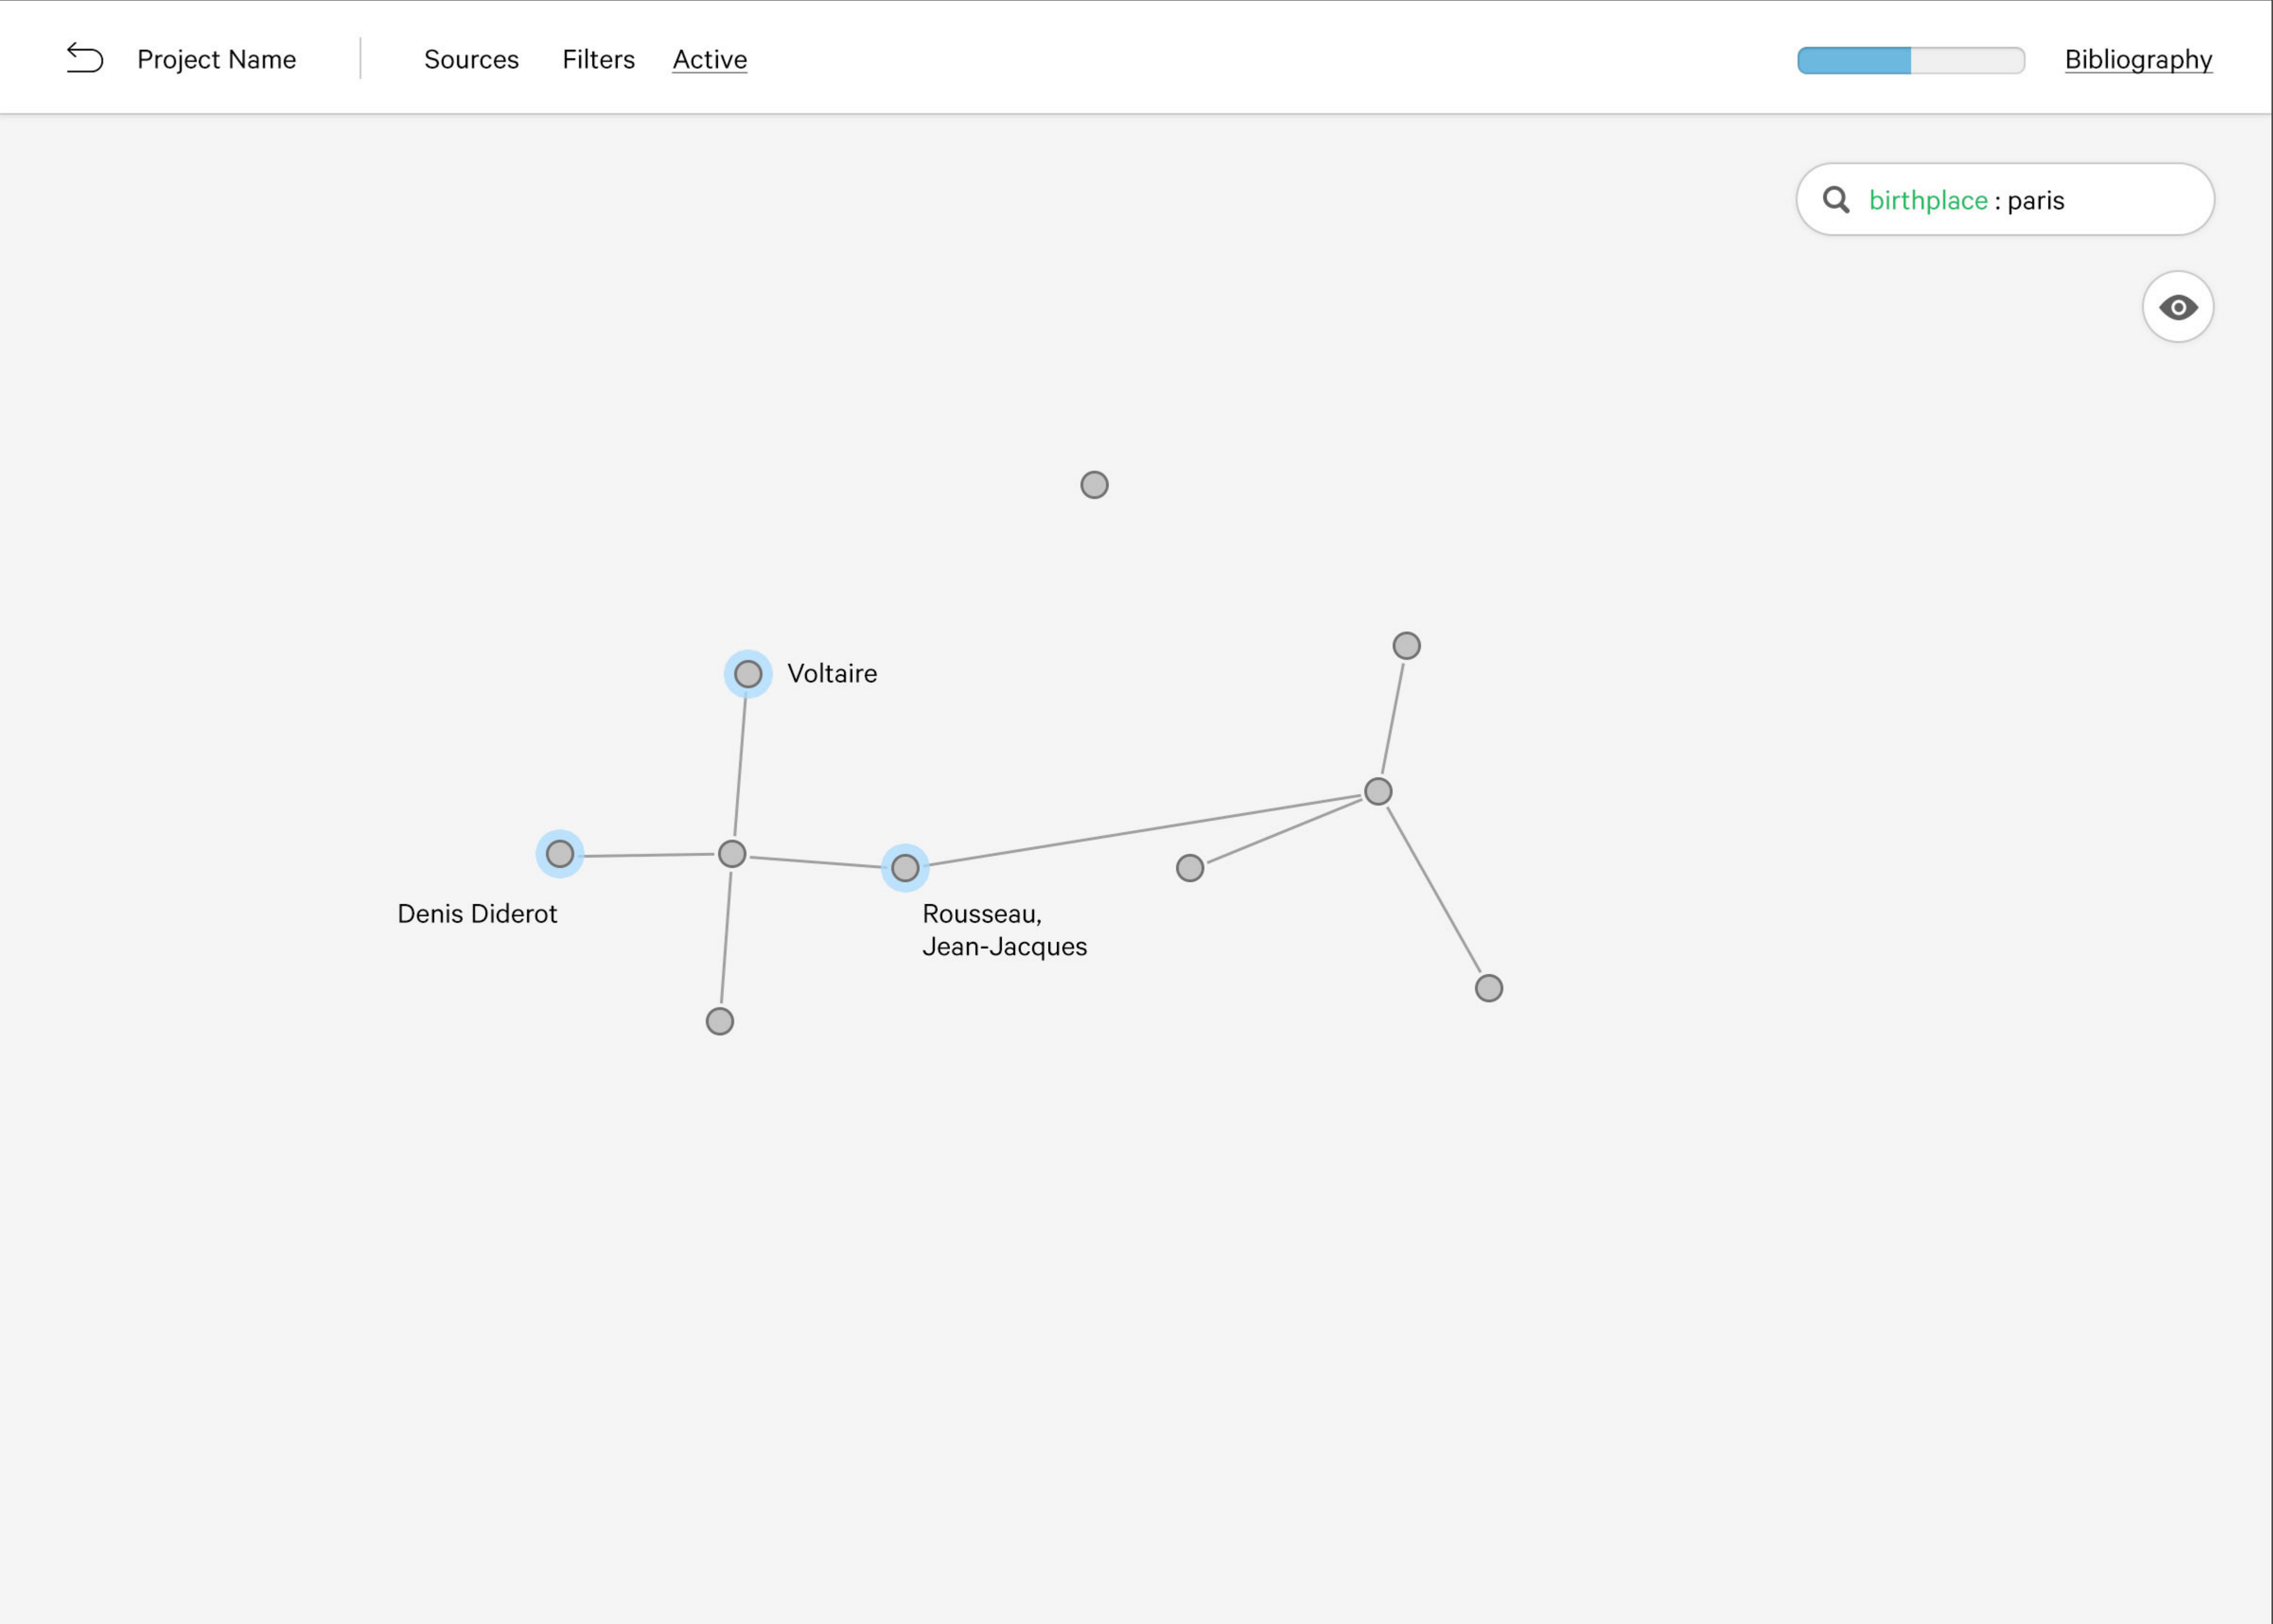

We know Voltaire's in here somewhere, but we don't remember where. When we search for him with the smart search bar, he gets selected and visually highlighted, and his label pops up.

Smart Search and View Options (3)

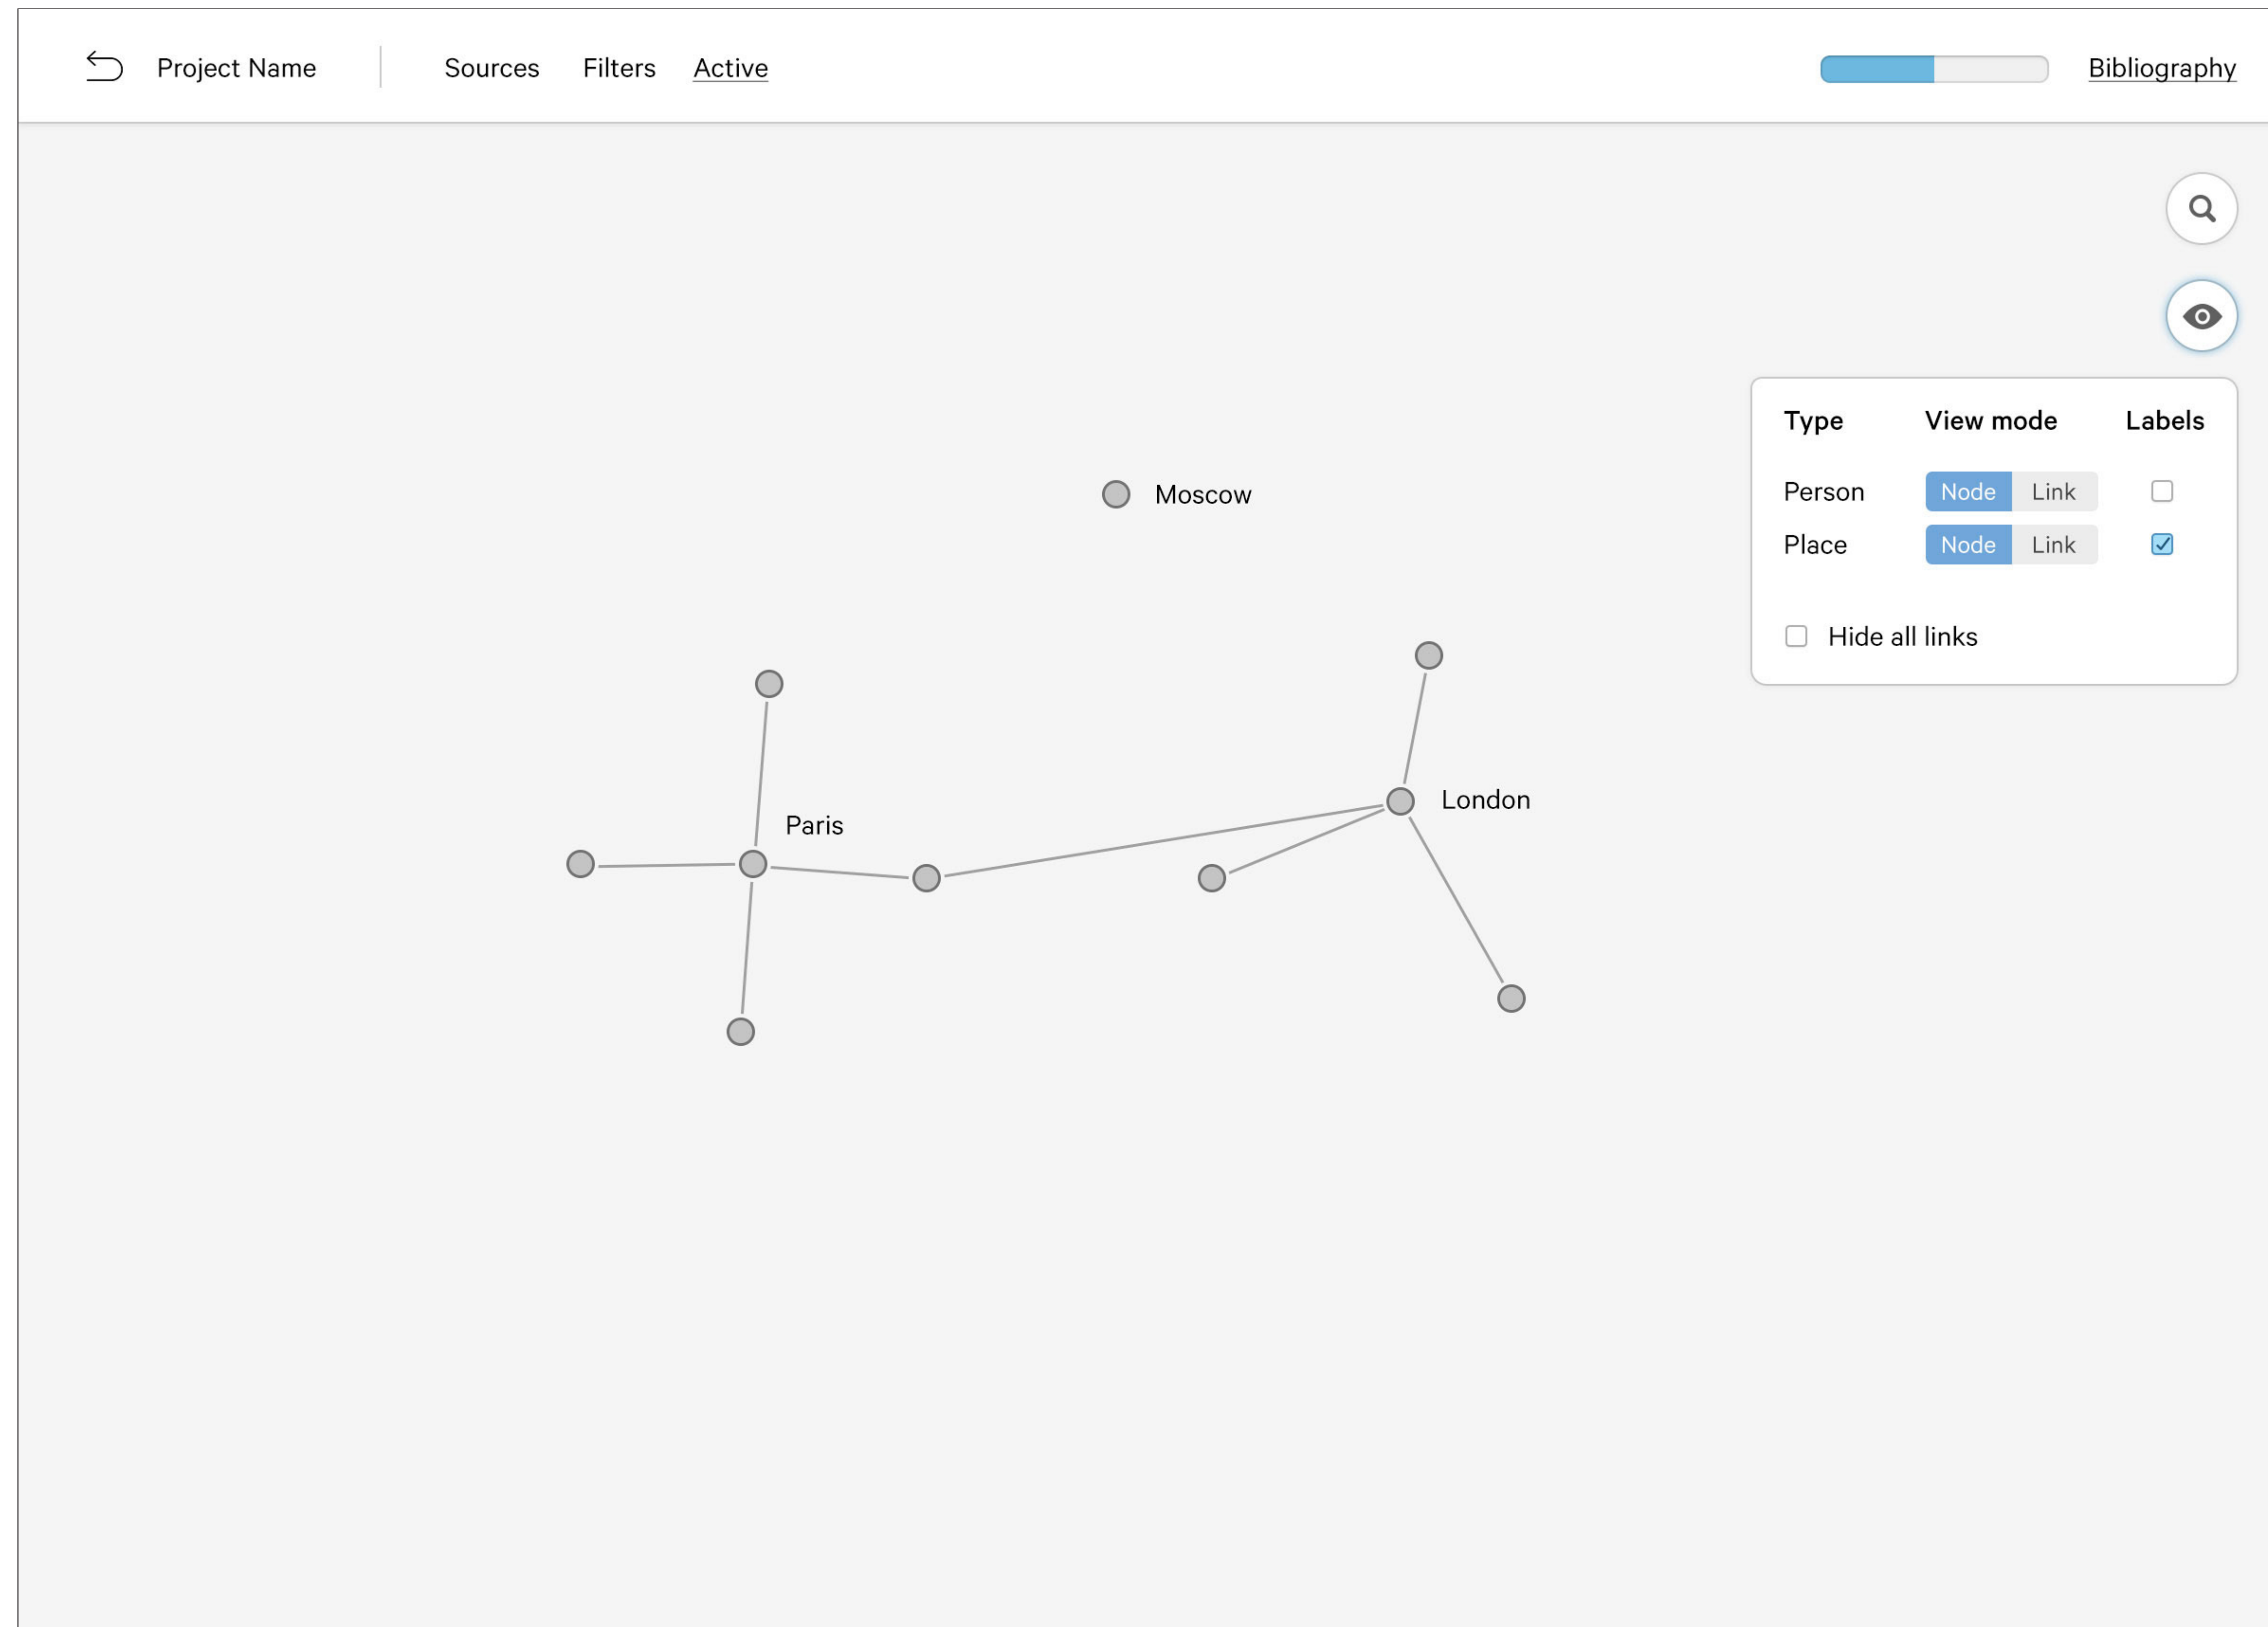

Similarly, searching for “Paris” will show us if/where Paris is on our canvas.

Smart Search and View Options (4)

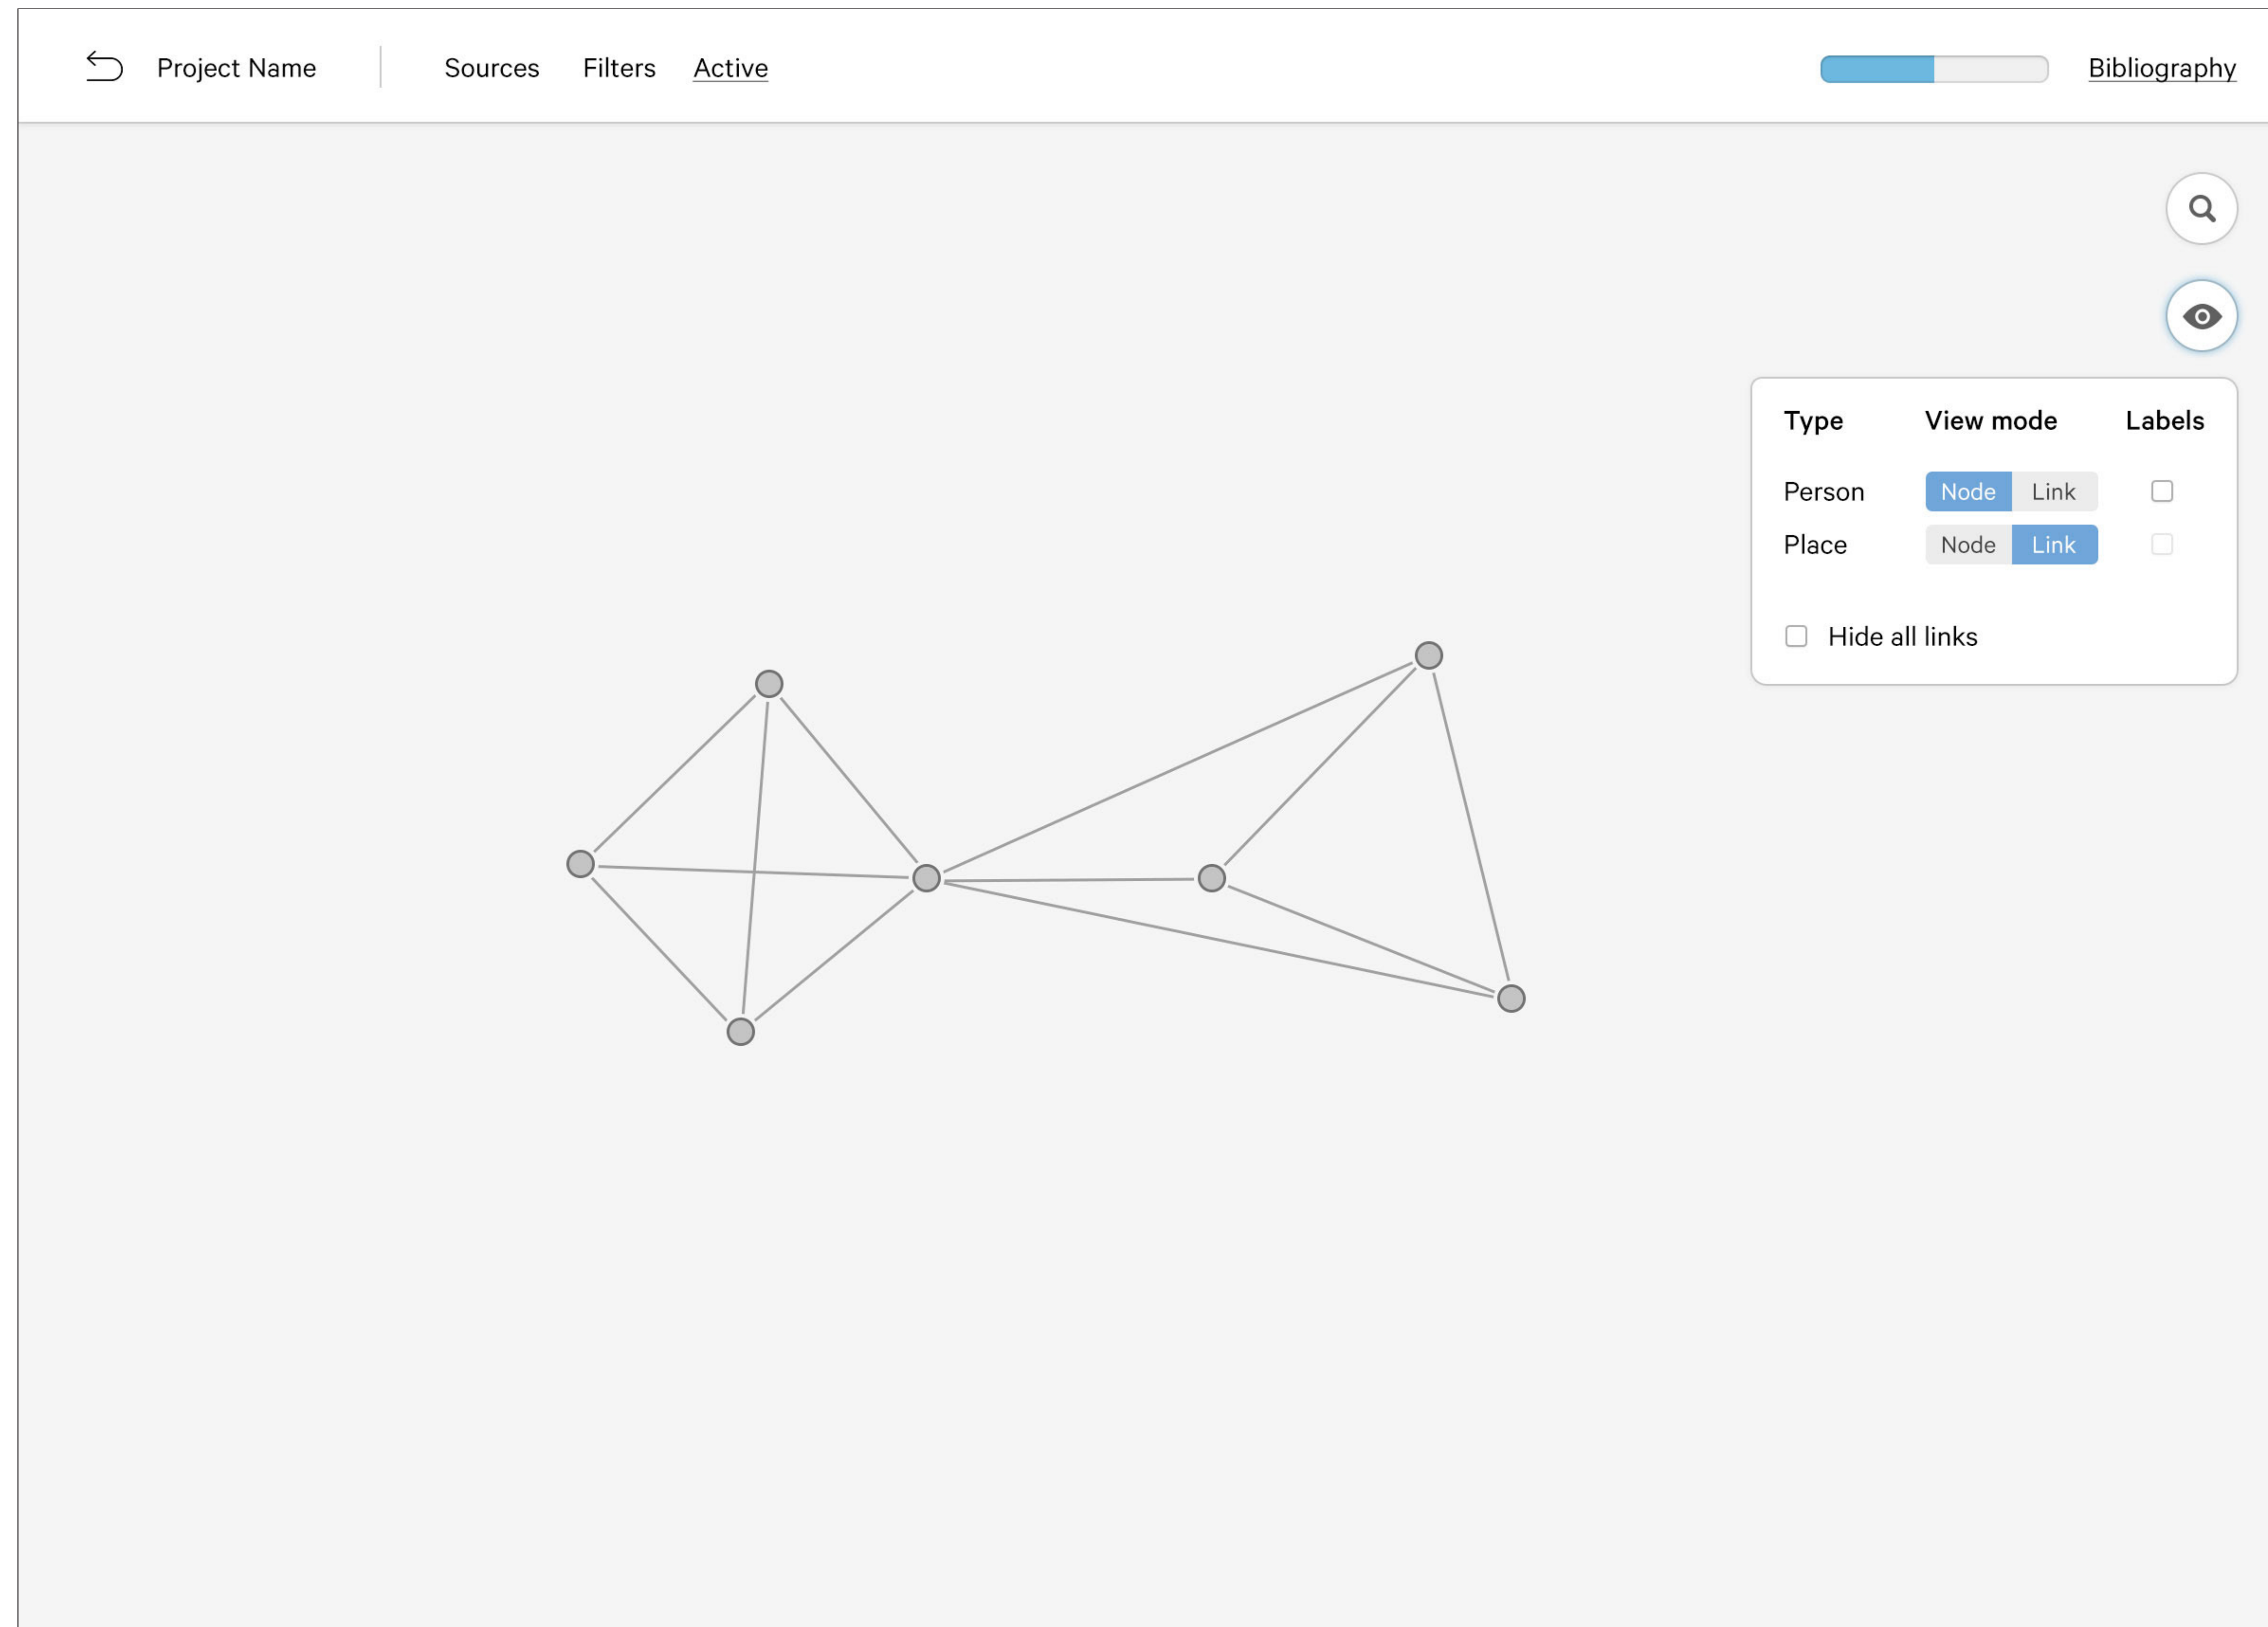

We can also use the smart search bar to search for entities with certain properties. If we search “birthplace: Paris”, any entities that match will be selected and highlighted, and again their labels pop up.

Smart Search and View Options (5)

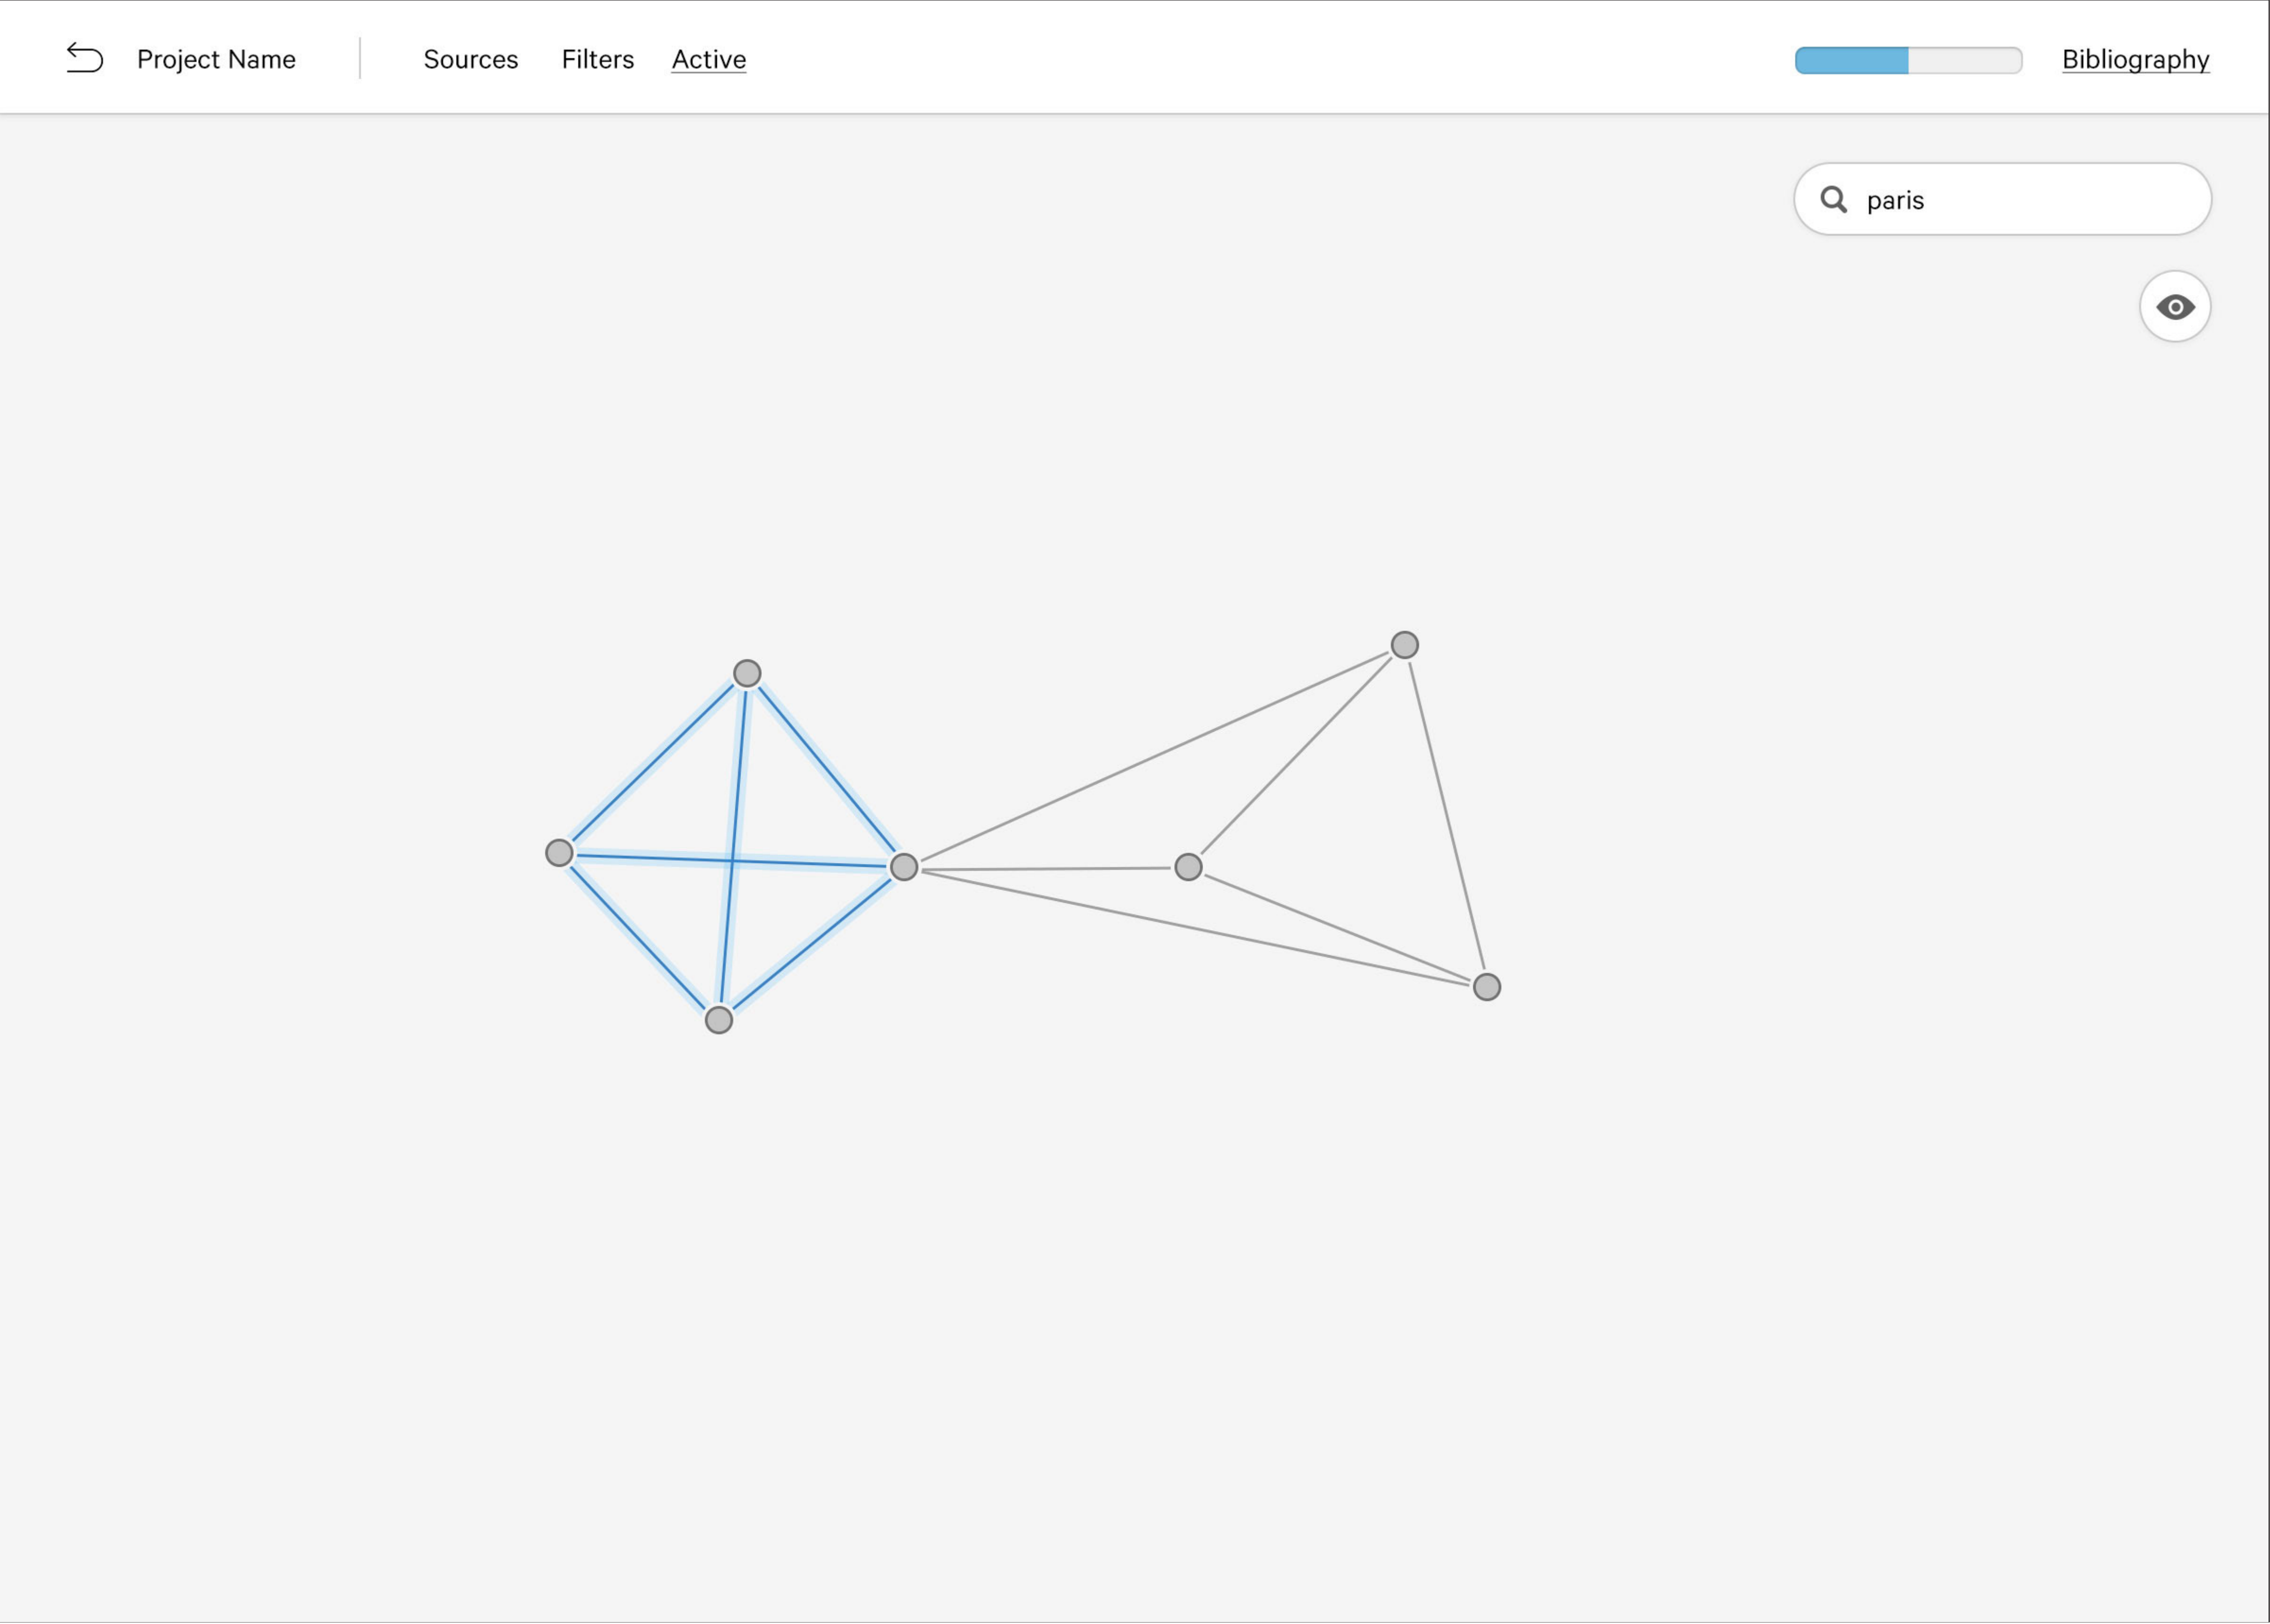

So that we can always keep track of entities of a certain type, we might want to turn their labels on all the time. We can do that in the View Options. Labels are toggled by type to help avoid clutter.

Smart Search and View Options (6)

The other key function in the view options is to toggle entity types between displaying as nodes and as links. If we toggle Place entities to links, their nodes (temporarily) disappear from the canvas, and they become links between Person nodes. Their labels go too, so that we don't have labelled links all over the place.

Smart Search and View Options (7)

Even when entities are displaying as links, the smart search bar can still find them. Searching for “Paris” will select and highlight any Paris links on the canvas.
